Insert Mandatory Programming Joke

THEYOPEN THEIR HANDS AND LET THE DELICATE WINGS FLAPONCE.

THE DISTURBANCE RIPPLES OUTWARD, CHANGING THE FLOW OF THE EDDY CURRENTS IN THE UPPER ATMOSPHERE.

THESE CAUSE MOMENTARY POCKETS OF HIGHER-PRESSURE AIR TO FORM,

WHICH ACT AS LENSES THAT DEFLECT INCOMING COSMIC RAYS, FOCUSING THEM TO STRIKE THE DRIVE PLATTER AND FLIP THE DESIRED BIT.

COURSE, THERE'S AN EMACS
COMMAND TO DO THAT.
OH YEAH! GOOD OL'
C-X M-c M-butterfly...

DAMNIT, EMACS.

Functions

In C++ we can subdivide the functional features of a program into blocks of code known as functions. In effect these are subprograms that can be used to avoid the repetition of similar code and allow complicated tasks to be broken down into parts, making the program modular.

Until now you have encountered programs where all the code (statements) has been written inside a single function called main(). Every executable C++ program has at least this function. In the next sections we will learn how to write additional functions.

Table of contents

- 1. Function Justification
- 2. Function Definition
- 3. Example of Function Definition, Declaration and Call
- 4. Function Header and Body
- 5. Function Declaration
- 6. Function Call and Execution
- 7. Function Arguments
- 8. Passing by Value or Reference
- 9. Recursion just to f*** with you

Function Justification

Function Definition

In C++, a function is a group of statements that is given a name, and which can be called from some point of the program. The most common syntax to define a function is:

```
returnValueType functionName(type parameter1, type parameter2, ...)
{
    statements;
}
```

Where:

return-value-type

function-name

parameters

Is the type of the value returned by the function.

Is the identifier by which the function can be called.

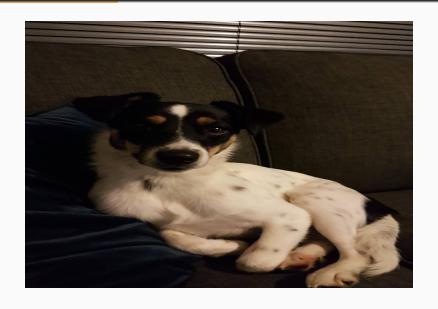

Each parameter consists of a type followed by an identifier, with each parameter being separated from the

next by a comma.

 $\begin{tabular}{ll} \textbf{statements} & \textbf{Is the function's body. It is a block of statements} \\ & \textbf{surrounded by braces} \ \big\{ \ \big\} \ \textbf{that specify what the} \\ \end{tabular}$

function actually does.
